PROJECTIONS

The space emerges through a new type of order between internal systems and external surroundings. Overlapping the view and the relation to the sky, the spatial systems and its appropriation and use, the roof functions as a layered scenography.

It constitutes in a space of co-existence between humans and infrastructure and with different climatic conditions, orientations and gradients of exposure to external conditions, it allows for a variety of uses.
Its qualities lay in its location as a high place, its relation to the sky and the external environment, but also in the characteristics of the infrastructure space itself.
